## HOW TO RAISE FLOWERS SUCCESSFULLY FROM SEED

**Tender, or Greenhouse,** means the plant will not stand the least frost. All such must be planted out late in the spring (May) or in a greenhouse.

**Half Hardy** means the plant will stand any light frost, but needs protection against very cold weather. These should be planted out in the spring (March and April), not in the fall.

**Hardy** means the plant will stand considerable frost, or practically all we have on the Pacific Coast. These may be planted in the fall or in the spring (September to May). If sown in the fall they will come into bloom earlier than if sown in spring, even if the plants do not make much progress during the cold weather.

**Annuals** are plants that bloom the first year from seed, and the plant dies after one season. Tender annuals must be sown in spring (February to June), and most hardy annuals may be sown either in fall or spring (September to May).

**Biennials** are plants that bloom the second year from seed, and the plant dies after the second year. In California some of these will bloom the first year if sown early. Sow under the same conditions as perennials.

**Perennials** are plants that bloom the second year from seed, and the plant lives and blooms during successive years. If sown in early spring (January to March), many perennials will bloom the first year from seed. Perennials are best sown in the summer and early fall (May to October) for next year's flowers.

**Cultural Directions**—It is better in most instances to start the seeds in pots, seed pans, or shallow boxes (flats). A soil

mixture prepared in advance of sowing, of 2 parts loam, 1 part of previously moistened peat moss, and from ½ to 1 part of sharp sand, is about right for most subjects. Have the soil just moist enough at the time of using, that it will ball when compressed, but will shatter when dropped. Fill the container within an inch of the top, firm well and level, and sow the seeds thinly. Cover the seeds lightly, and keep moderately moist by use of a very fine spray.

In the spring set the seed box in a warm place, but protected from the direct rays of the sun; while in the summer and fall it is important to provide a cool and moist condition for the successful germination of Columbine, Pansy and Viola, Primula, and perennials generally. Protect the seed boxes from sowbugs which may eat the sprouts unobserved, and ants which often carry small seeds to their nests.

When the plants have made the fourth leaf they should be picked out, reset in another box, and transplanted to the garden when well started. When the seedlings are first set out, shade for a few days, and water frequently.

If the seed is to be sown directly in the garden, the soil should be well worked and fertile. Sow thinly, press the soil down firmly, and cover lightly with a soil similar to the mixture described above; the small seeds needing but a dusting to cover them sufficiently. Keep the ground moist by the use of a fine spray, but not to the point of saturation.

Small plants in the garden may be protected from chewing insects, by a light dusting with Acme Garden Guard.

**NON-WARRANTY** While the greatest care is exercised to have all seeds and plants of good quality and true-to-name, the Hallawell Seed Company gives no warranty, express or implied, as to the description, purity, productiveness, or any other matter of any seeds, bulbs, or plants they send out, and will be in no way responsible for the crop.

## ANTIRRHINUM

### Hallawell's Snapdragons

**RUST RESISTANT STRAINS** (Year Round)

Snapdragons are one of the best cut flowers, while for beds or borders they are a constant source of pleasure. They succeed best in a rather light soil in a sunny situation, and although perennial are best treated as annuals. For early flowering sow in the fall, protecting the plants from frost. Sown in spring, they bloom from mid-summer until frost. These Rust Resistant Snapdragons are offered as being the best obtainable, and although not entirely immune to rust, will flower much more satisfactorily than the old type. It has been found that different species of rust perhaps exist, and that the totally resistant strain is yet to be achieved.

Sow the seed where it is to remain late in the spring after danger of frost is over. It is seldom necessary to thin the young plants, as they will bear standing close together.

### CULTURE OF SWEET PEAS

Dig a wide trench to a depth of 12 inches and after breaking up the bottom of trench fill in with several inches of peat or leaf mold to which add a liberal amount of bone meal; fill in the balance of the trench with good top soil. Tamp the soil down firmly and water thoroughly to the base. Let stand a few days until moderately moist. Never put the seed in too wet soil. Pulverize the surface well by raking, make rows and plant seed about one inch deep, and two inches apart. Do not water until all the seed is up, at least half an inch out of the soil. Sweet Pea seed sown during hot weather should be shaded with muslin or a mulch of loose straw or twigs, to keep the soil cool and prevent decay of the seed.

Thin out to at least six inches apart and train on wire netting or strings when plants are five or six inches high. Applications of Sweet Pea Food during flowering period will add to the length of stem and size of blossoms. Keep well cultivated and water only as needed during the blooming period, as excessive moisture will cause the buds to drop.

**CALIFORNIA WILD FLOWERS**

On the Pacific Coast, sow successively from fall to early summer; in the East and Middle States, from March to May.

Successive sowings of Wild Flower seed will provide bloom almost the year round in California, especially in the cooler regions and if the plants can be watered. Although they respond best to careful soil preparation, scatter plantings are successful if the seed is sown at seasons when the plants will have benefit of rainfall. In areas where wild shrubs abound, it is better to concentrate your efforts on the clear spaces, and assure success by scarifying the soil with a mattock or heavy rake to make it easier for the seeds to root.

One ounce of seed will sow 150 to 200 square feet in a home garden planting, while one pound to 5,000 square feet is recommended for a city lot broadcast planting. For hillside or field planting, 5 to 8 pounds per acre are required, depending upon the existing growth of wild shrubs. Mix an equal quantity of sand with the seed as an aid to equal distribution.

Care should be taken that roots are well spread, and set at a depth of 6 inches below the level of the bed. Cover only 2 or 3 inches, and fill in gradually as the plants grow. Very little, if any, should be cut the first year after transplanting, but a fair crop can be cut the second year. Plant the seed in slightly raised hills, 4 feet apart each way, place 6 or 8 seeds in each hill in a circle and cover with one inch of fine soil. After the plants are well started thin out to 4. Cucumbers thrive on well rotted compost and a shovelful of old manure should be placed 6 inches deep under each hill and firmly tramped down. Have the soil moist before planting so that no watering is required until the seeds have sprouted, otherwise they may rot. After they begin to set fruit, water freely by sprinkling vines for about 10 minutes every other day or so. They mature in 120 days. One ounce will plant 100 hills.

## MUSKMELON

A light, warm, rich soil is essential for this crop. When all danger from frost is over, plant the seed in slightly raised hills 4 feet apart each way, placing 6 to 8 seeds in each hill in a circle and covering with one inch of fine soil. Place a shovelful of old manure about 6 inches under each hill and tamp down firmly. Have the soil moist before planting so that no watering is required until the seeds have sprouted, otherwise they are apt to rot. After all danger of destruction by bugs is over, thin out to 3 plants to a hill; when about 1 foot long pinch off the tips to make them branch. This strengthens the growth of the vines and makes the fruit mature early. Muskmelons mature in 120 to 140 days. One ounce will plant about 50 hills.

**DELICIOUS GOLD LINED ROCKY FORD**—Fruit is heavily netted, slightly oval with no ribs. Has green flesh with a gold margin next to the seed cavity; thick meated and of fine flavor. Pkt., 10c; oz., 20c;  $\frac{1}{4}$  lb., 50c; lb., \$1.50.

## WATERMELONS

The culture of watermelons differs from that of muskmelons mainly in that the hills should be wider apart, from 8 to 10 feet, according to the variety grown. An effort should be made to secure good strong vines early in the season, and this can best be done by taking care that the hills are large, mellow, and well drained, with the manure placed so that they will not dry out quickly under hot sun. Plant the seeds thickly when danger of frost is over and thin the plants to four of the strongest in each hill. All possible protection from insects should be given the young plants and their growth may be still further hastened by frequent application of liquid manure. They mature in 120 to 140 days. As a protection from insects, netting is frequently used. One ounce will plant about 25 hills.

**ANGELENO**—A round deep green melon, rind very thin, flesh deep red and of fine flavor; good shipper. Pkt., 10c; oz., 20c;  $\frac{1}{4}$  lb., 40c; lb., \$1.25.

## ONIONS

Shallow planting is advisable,  $\frac{1}{4}$  to  $\frac{1}{2}$  inch being about right. When 2 or 3 inches tall, the young plants can be thinned to prevent crowding. They may be thinned again when 6 or 8 inches tall, and the plants removed can be used as green onions. ## RADISH

Radishes thrive best in a light, rich, mellow soil, and to bring out their mild qualities they must make a quick and tender growth. Sow early in spring and well into summer for succession, in well-manured, deeply dug and finely raked soil; if not well stimulated into a rapid growth, they become fibrous and tough; sow in drills 10 inches apart and  $\frac{1}{2}$  inch deep, and thin to 2 inches in the rows. ## SORREL

The large leaves, when cooked like Spinach, make a very palatable vegetable. In California it grows luxuriantly, spreads rapidly from the root, and becomes an obnoxious weed unless given attention. A confined location in the garden is therefore recommended.

## SQUASH

Squash should be planted in a warm, rich soil, after the weather has become settled and warm, about the beginning of May or June. Plant in well-manured hills, in the same manner as Cucumbers or Melons—the bush varieties 3 or 4 feet apart each way, and the running kinds from 6 to 8 feet. 8 to 10 seeds should be sown, 1 to 2 inches deep, in each hill, thinning out after they have attained their rough leaves and danger from bugs is over, leaving 3 or 4 of the strongest plants to a hill. The soil should be moist before planting so that no watering is required until the seeds have sprouted, otherwise they may fail to germinate. An occasional feeding of liquid manure will repay in size of fruits. One ounce of the summer varieties will plant about 25 hills and one ounce of the winter varieties about 15 hills. Summer sorts mature in 65 days and the winter sorts in 150 days.

## TOMATO

For early plants sow in hotbeds early in March or April, in drills 5 inches apart and  $\frac{1}{4}$  inch deep; when the plants are about 2 inches high transplant into another hotbed 4 inches apart each way; plant out in the open ground early in May, or as soon as danger from frost is over, 4 feet apart each way in hills, which should have a shovelful of well-rotted manure mixed with the soil. Water freely at time of transplanting, but after the plants are well established water sparingly and at the roots only, as spraying the vines and overwatering causes the blossoms to drop off; when the first fruit is set, pinch off the ends of the branches to obtain early fruit. Sufficient plants for a small garden can be grown in a shallow box by placing it in a sunny window in a warm room. For late use sow in a sheltered border in May, and set out the plants in July; the green fruit may be picked off before frost and ripened under glass. By training the vines on trellises or tying to stakes, the fruit will ripen better and be of finer quality. The fruit matures in 150 days.

## LAWN GRASSES

**To Make a Lawn**—Spade deeply, adding a good humus material, sheep manure or other organic fertilizers which contain no weed seeds. Rake to the desired grade and water thoroughly to settle the soil evenly. If this preparation is made two weeks in advance of sowing, the surface weed seeds will have germinated and may be removed. Now rake for the final grade and broadcast the seed at the rate of one pound to 150 square feet, except where other quantities are suggested.

To prevent surface drying and crusting cover the seed lightly with a mixture of soil and moistened peat moss. Sprinkle carefully, using a fine spray to prevent washing. Water thoroughly, but avoid applying too much in one place to form puddles, which may float the seed and mulch into low spots. Sprinkle daily until seed has germinated, and when the grass has grown about one or two inches, pull all weeds and mow. To maintain deep velvety green turf apply a good commercial fertilizer three or four times a year.

For steep banks or slopes, burlap is sometimes used instead of mulch. It keeps the surface moist and prevents washing. Remove the burlap as soon as the seed germinates.

All of our grass seeds are the best grade. Please write for prices on larger quantities and quotations will be made promptly on the basis of the current market. Prices fluctuate and quotations below are not guaranteed.

**WE PAY POSTAGE** anywhere within U. S. on items of grass seeds priced at 50c per pound or more. On other items refer to parcel post chart on inside front cover.

**SEASIDE BENT** (Coos County Bent)—A true creeping bent which roots at each joint where it contacts the soil, producing a thick, smooth, and enduring turf. Once established, the growth is upright, of fine texture, and a beautiful rich green. Seaside Bent succeeds for golf course and lawn under varied soil and climatic conditions. Sow one pound to 500 square feet. Certified seed. Lb., \$1.50; 5 lbs., \$6.75; 10 lbs., \$12.50.

**ASTORIA BENT**—Spreads from underground rootstalks, and produces a splendid rich green turf of upright growth and fine texture. Sow one pound to 500 square feet. Certified seed. Lb., \$1.50; 5 lbs., \$7.00; 10 lbs., \$13.50.

**CHEWING'S FESCUE**—Produces a dense, lasting turf, succeeding well even under adverse conditions. It is used extensively in lawn and putting green mixtures. Lb., \$1.00; 5 lbs., \$4.85; 10 lbs., \$9.25.

**HALLAWELL'S EVERGREEN LAWN MIXTURE** — A blend of several deep green, fine bladed grasses, producing a good thick turf and remaining green both winter and summer. It thrives in heavy or black soils. Lb., 75c; 5 lbs., \$3.50; 10 lbs., \$6.75.

It provides an excellent turf which will withstand hard usage. Sow one pound to 100 square feet. Lb., 60c; 5 lbs., \$2.65; 10 lbs., \$5.00.

**KENTUCKY BLUE GRASS**—The most popular grass for lawns. It is a dark green and of dense growing habit, making a beautiful turf in a heavy or black soil.

Standard Grade—Thoroughly recleaned seed. Lb., 50c; 5 lbs., \$2.35; 10 lbs., \$4.50.

**PACIFIC RYE GRASS** (Pacey's Rye Grass, Imported)—

**RED TOP GRASS**—Gives a quick effect and succeeds on all soils, though doing best on moist soils. Should be in all lawn mixtures. Lb., 50c; 5 lbs., \$2.35; 10 lbs., \$4.50.

**ROUGH STALKED MEADOW GRASS** (*Poa trivialis*)—

An ideal perennial shade grass which is closely related to Kentucky Blue Grass, but somewhat finer and softer. It has an apple-green color and is a creeper. Requires plenty of moisture. Lb., 95c; 5 lbs., \$4.50; 10 lbs., \$8.50.

**SHADY NOOK MIXTURE**—A blend of suitable lawn grasses which thrive in the shade and under trees. Lb., 90c; 5 lbs., \$4.25; 10 lbs., \$8.25.

# Hallawell's Roses

**HALLAWELL'S SELECT ROSES** are a selected No. 1 grade. They are grown under soil and climatic conditions suitable for production of vigorous bushes which will grow to strong sturdy plants. There are four commercial grades of roses and Hallawell's Select Roses are selected first grade. Bush Roses will bloom freely the first year, while climbing varieties often require two years or more to bloom profusely.

Bare root bush and climbing varieties are usually ready for delivery in December if weather conditions permit digging. They are available during January, February and March or until the bare root supply is exhausted.

**PLANTING**—Before planting dormant roses, remove the small branches and cut back the large ones to 5 or 6 inches, leaving an outside bud at the top. Plant to a depth where the bud-union will be just below the surface and pack the soil well around the roots, leaving no air spaces. Well-rotted manure and bone meal or other suitable fertilizer may be placed on the surface as a mulch after planting.

**SPRAYING**—To prevent and control mildew, and to destroy aphid and scale, spray periodically with a fungicide and an insecticide. A good combination which may be used together in one spraying, is a solution containing 6 tablespoons of Acme Kopper Queen, and 3 tablespoons of Acme Emo-Nik, to one gallon of water.

## PRUNING ROSES

Pruning should be done during the dormant season, usually from December to February. In general weak growing varieties may be pruned more severely than stronger varieties. Pruning operations may be divided into three classes:

**Severe**—Thin out all but 3 to 5 canes, and cut these back to leave 2 or 3 eyes on each cane.

**Medium**—Thin out all but 4 to 6 canes, and cut back to 3 to 4 eyes each.

**Light**—Thin out all but 4 to 7 canes and cut back to 5 or 6 eyes.

Obviously the more severe pruning reduces the number of flowers, but improves the quality. In shortening canes, always cut to an outside bud, and the cut should be  $\frac{1}{4}$  inch above the bud. This tends to broaden the bush and prevents dense center growth. In removing canes or laterals entirely, use sharp shears, and make a smooth clean cut as close as possible to the older wood from which it springs. A clean cut will heal smoothly, while a stub left may decay and cause injury.

**Climbing Roses** require little pruning. At most the laterals on main canes may be shortened to 3 or 4 eyes, and other brush removed to keep the top within bounds. Old canes may be replaced by new ones growing from the base of the plant, if it seems desirable.

**Cutting the Flowers**—Cutting roses with long stems is desirable, and is in effect summer pruning. Cut the stems to within 2 or 3 eyes of the main lateral, and follow the same procedure with the flowers which have been permitted to remain on the bush, as soon as they have faded. Also remove small branches and brush growth in July when the rose garden is fertilized, to improve the fall crop.

# Dahlias

## CULTURE OF DAHLIAS

Although Dahlias are easily grown in any good garden soil they respond readily to good cultivation. Prepare the soil by digging 12 to 18 inches deep and working in a moderate amount of well rotted manure or commercial fertilizer. Plant the bulbs 2½ to 3 feet apart at a depth of 5 or 6 inches. Give them just enough water when above ground to keep them growing slowly. Apply fertilizers and water in quantities only after the plant begins to bud. Dahlias may be planted from March to July, preferably in May.
